

The ***Airspace Bump Test Kit*** is used to perform an optional gas verification test on any of the Airspace Gas Monitors. Exposing the monitors to a gas level that exceeds the alarm levels will verify that the monitors are fully operational and performing at the proper sensitivity. The manufacturer recommends this fairly simple but effective test be performed on a regular basis. The Bump Test Kit comes in a durable and lightweight case and has a regulator with gauge for managing flow rates. Carbon monoxide gas for testing is not included with the kit, but is available in 50 or 150 ppm, 34 liter containers separately.
