

# LED Config Setup

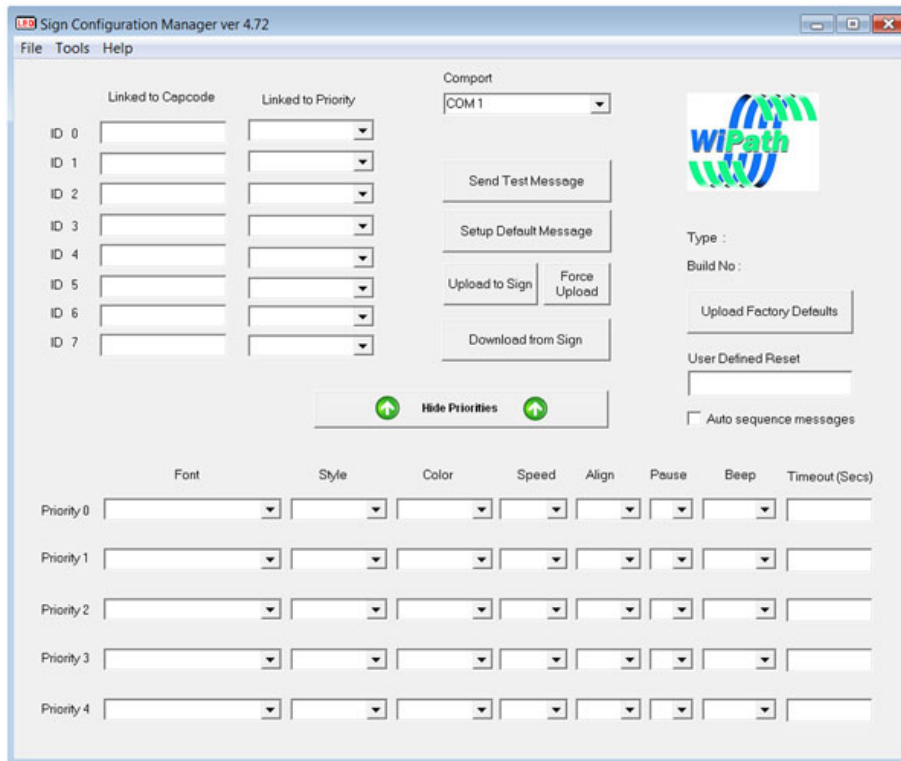

[www.wipath.com](http://www.wipath.com)

1. Plug provided Serial cable (See Picture below) from LED sign to Serial Port on computer.

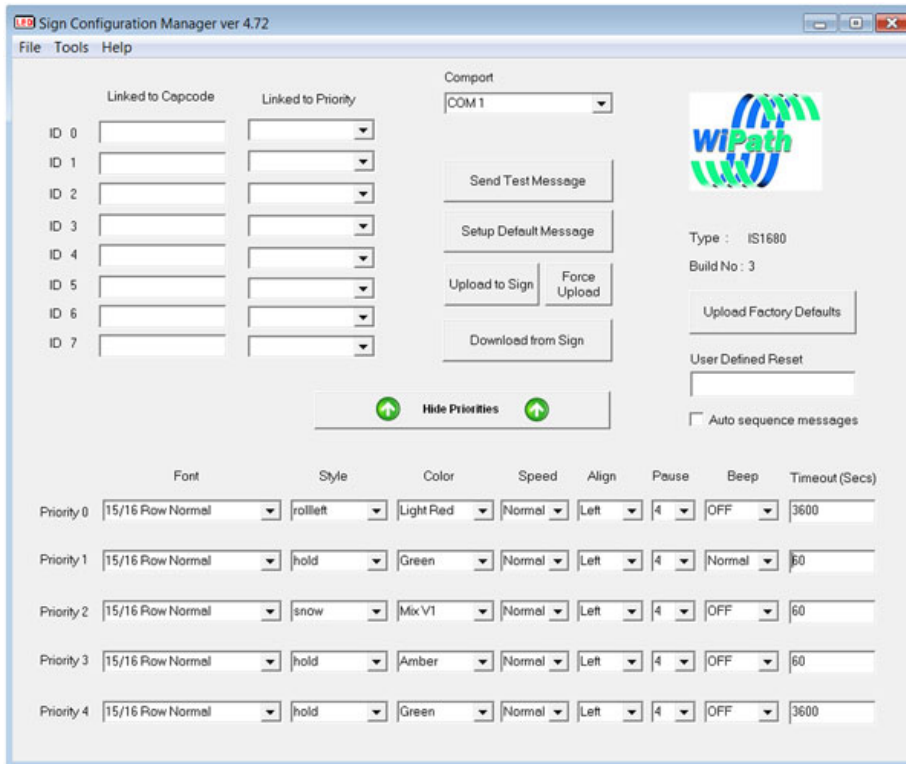

2. Power up LED Sign and open LED CONFIG software on computer.

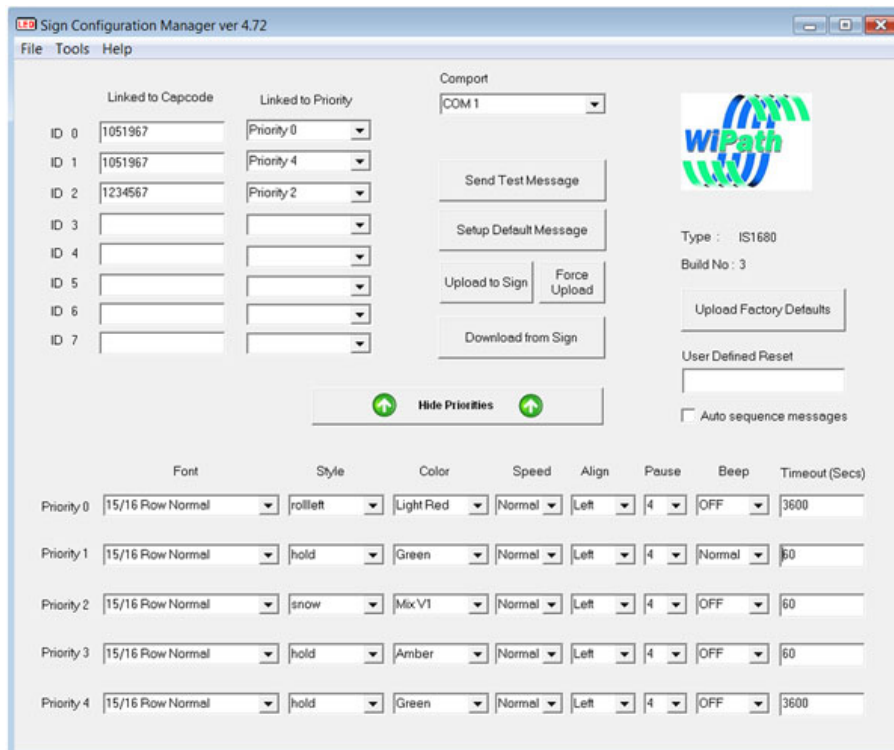

3. The LED CONFIG software will now search for the sign on your computers serial port. Please check that the LED Sign is plugged into any one serial port from port 1 through to 12 on your computer as the LED CONFIG software can only read up to 12 serial ports.

4. Once the LED CONFIG software has found the sign, the following will be displayed on software:

5. Now setup the PRIORITY's 0 to 4 according to how you want the message to be displayed on the LED Sign.
6. Then link a PRIORITY to a Capcode (RIC). The Capcode (RIC) that will be input depends on which Capcode (RIC) was setup on the PSR using the PDT3P software.  
i.e. User cannot enter a Capcode (RIC) that is not programmed into PSR.
7. There can also be a reset command that can be setup using LED CONFIG for example RESET or 999. This can be input in the "User Defined Reset Command" box.
